Introduction

This openfile report is a listing of all stratigraphic sections used in compiling the Alberta Geological Survey's Report on "Geology and Resource Potential of Phosphates in Alberta". All of the stratigraphic details, natural radiation measurements taken with a gamma-ray spectrometer and chemical analyses available appear for each section. Chemical analysis are available for the elements; phosphorous - as P2O5, vanadium - as V ppm and uranium - as U ppm.

For the most part the data is self-explanatory with all of the information in stratigraphic order: youngest at the top of the page, oldest at the bottom. Each line of data represents a described portion of the section.

Guide to the Raw Data

The following header appears above each stratigraphic section and a series of notes has been compiled to explain each of the headings. Figures 1, 2, 3, 4 provide nomenclature definition within the various formations listed - in their presumed time/stratigraphic position.
